

RUNSWITCH™ 7.5 Amp Power Module

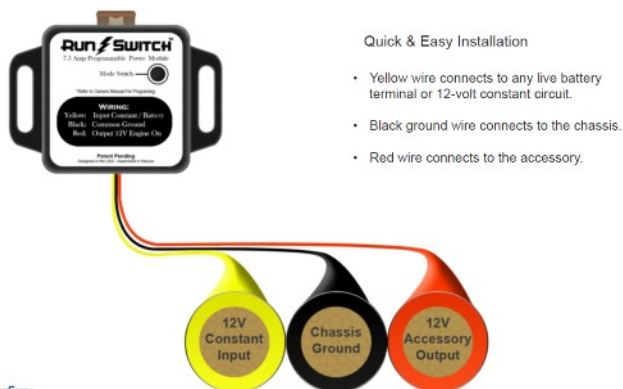

RunSwitch creates an accessory output providing 12-volt power with the engine running and turning off with the key off.

- RunSwitch simplifies any 12-volt accessory installation by quickly and easily connecting the accessory to the battery or any 12-volt constant circuit.
- RunSwitch has an internal LED fuse, which illuminates when power is activated allowing for quick and easy set-up, functional circuit confirmation and diagnostics.
- RunSwitch can be used with 1 or more accessories as long as 7.5 amps is not exceeded.
- When more than 7.5 amps is needed simple, low cost relays can be used.
- Save time and money – RunSwitch can reduce installations time by hours.

RunSwitch Plus combines 3 functions.

- Power Mode provides the same function as the original RunSwitch - quick, easy and cost effective accessory installations.
- The programmable Timer Mode extends power delivery to accessories after the engine is turned off.
- Battery Saver Mode disconnects the accessory power when the battery level is low ensuring the battery will not fully drain.
- RunSwitch Plus also has an internal LED fuse, which illuminates when power is activated allowing for quick and easy setup, functional confirmation and diagnostics.

The Timer enables the accessory output to remain ON for a predetermined amount of time after the engine is turned OFF.

- The Timer delay function is user adjustable from 1 minute to 90 minutes.
- Timer Mode is ideal for mimicking CAN BUS shut down times and creating a retained accessory power (RAP) circuit.

Battery Saver Mode enables the accessory output to remain ON after engine is turned OFF.

- With Battery Saver Mode the module will automatically monitor the battery charge level, turning output OFF if the battery level falls below a predetermined safe voltage level.
